EXPERIENCE

IBM, Lowell, MA

Software Developer Intern

Jul 2026 - Aug 2026

- Developed the AI-Driven Insights workflow within IBM Bob, an AI-powered FedRAMP compliance engine, creating guided interfaces for Select Finding, Explain Finding, Remediation Guidance, and Re-Validation workflows
- Architected decision-branching logic following SSP creation, implementing two conditional flows and mapping frontend-to-backend interactions across the IDE, CI/CD pipeline, and compliance engine
- Documented application setup and configuration workflows for engineering teams, reducing new-engineer onboarding time by 25% while improving consistency across development environments
- Completed secure-SDLC implementation and collaborated across engineering workflows involving data privacy, incident response, application development, and production-oriented software practices

Cybersenz, Silicon Valley, CA

Software Development Co-op

Jan 2026 - Jul 2026

- Engineered cybersenz.com from the ground up using multi-page web application architecture, dynamic job listings, product landing pages, and protected contact and application workflows
- Automated an end-to-end AI scheduling pipeline for a personal injury clinic, integrating referral intake, lien-agreement population, patient-record creation, and multi-location scheduling into a unified application workflow
- Integrated AI intake agents for voicemail and eFax processing, combining transcription, urgency classification, and routing while implementing access controls, audit logging, and HIPAA-aligned data handling
- Secured application workflows through controlled data access and audit mechanisms, supporting reliable handling of sensitive information across automated client-facing systems

Infosys Limited, Pune, India

Systems Engineer → Technology Analyst

Nov 2020 - Jul 2024

- Implemented TypeScript and React components integrated with backend REST APIs and Go/Python microservices, improving customer-facing application performance by 34%
- Optimized frontend-to-service workflows across production applications by analyzing application behavior and backend interactions, reducing performance bottlenecks across customer-facing modules
- Streamlined CI/CD pipelines using AWS services and GitHub Actions, reducing deployment friction by 39% and release latency by 45% across production engineering workflows
- Translated business requirements into user stories and implementation requirements with client-facing and stakeholder teams, accelerating development cycles by 27% and improving feature-delivery coordination.
- Established production monitoring and automated test coverage across full-stack modules, resolving 92% of issues before customer escalation and increasing overall test coverage by 42%
- Diagnosed application defects through systematic debugging, testing, and performance evaluation, improving release reliability across multiple production software modules

SKILLS

- **Frontend:** TypeScript, JavaScript, React, HTML5, CSS, Responsive Web Applications, UI Development
- **Software Engineering:** REST APIs, Application Design, Algorithms, Git, CI/CD, Automated Testing, Debugging, Performance Optimization
- **Programming:** Python, C++, C, Java
- **Cloud & Infrastructure:** AWS, Azure, Virtual Machines, Containers, Docker, Infrastructure Monitoring
- **DevOps & Tooling:** GitHub Actions, Jenkins, Azure DevOps, CI/CD Pipelines, Python Automation, Linux
- **Networking:** TCP/IP, DNS, DHCP, VPN, Wireshark, ns-3, Network Simulation, Routing, Switching
- **Security:** Threat Analysis, Vulnerability Management, SIEM, Incident Response, Risk Assessment

PROJECTS

Northeastern University

DevOps Networking Automation

Dec 2024

- Constructed C++ automation pipelines supporting distributed messaging, achieving 96% stable throughput across multi-node scenarios and demonstrating scalable engineering approaches under simulated production workloads
- Engineered data integrity checks and monitoring routines, increasing link reliability by 41% and showcasing modern system-level development practices aligned with enterprise cloud communication expectations
- Implemented scheduled event-driven execution modules reducing latency jitter by 37%, validating deterministic timing behavior essential for complex distributed system coordination
- Measured protocol behavior using monitored traces, lowering overall error rates by 28% and demonstrating data-driven debugging required in high-complexity software systems

EDUCATION

Northeastern University, Boston, MA

Master of Science in Computer Engineering

Dec 2026

GPA: 3.76/4

Concentration: Computer Networks and Security

Coursework: Fundamentals of Computer Networks, Computer Hardware Security, Computer Systems
